

Topic: OSI Model, TCP/IP Model & Wireshark

Packet Analysis

1. OSI Layer Explanations

Layer 1 – Physical Layer

This layer is the quiet workhorse of the network world. It deals with the raw signals—electrical pulses, light flashes, or radio waves—that travel through cables and air. No understanding of data happens here; it's just bits marching in a steady rhythm. Ethernet cables, fiber optics, Wi-Fi radio signals, voltage levels, connectors, and physical topologies belong here. You can imagine it like the actual road on which vehicles travel: without the asphalt or the rails, nothing else can move.

Layer 2 – Data Link Layer

Here the network gains awareness of neighbors. The Data Link Layer shapes raw bits into frames, attaches MAC addresses, and checks for errors using CRC. Switches, NICs, VLANs, ARP, and protocols like Ethernet and PPP live here. It's the traffic manager inside a city block: it ensures local deliveries reach the right door, even if the rest of the world remains a mystery. Collisions are handled, and corrupted frames are quietly filtered out so higher layers don't panic.

Layer 3 – Network Layer

This is the layer where a device learns how to travel beyond its local area. The Network Layer handles logical addressing and routing—IP addresses, subnets, routers, and routing protocols like OSPF, RIP, and BGP. Packets may hop through multiple networks, each router choosing the next turn based on routing tables. It's like the postal service's long-distance system: envelopes move from city to city through a maze of interconnected routes until they find the right region.

Layer 4 – Transport Layer

Here the network learns to care about reliability and order. This layer decides whether data should arrive carefully (TCP) or quickly (UDP). It forms segments, tracks port numbers, handles re-transmissions, flow control, and ensures that scattered pieces of data get reassembled like puzzle tiles. It resembles a courier service that either delivers

fragile items with great caution or drops off parcels rapidly with no signatures—depending on what the sender wants.

Layer 5 – Session Layer

The Session Layer is like the host of a long conversation. It creates, manages, and gracefully ends communication sessions between devices. It keeps track of who is speaking, when, and ensures that if a connection drops, it can be resumed. Protocols such as RPC and NetBIOS sit here. Think of it as a moderator in a meeting room who ensures that the discussion keeps flowing without two people talking over each other.

Layer 6 – Presentation Layer

This layer acts as the translator and stylist of the network. It converts data into formats that applications can understand—handling encryption, compression, and encoding. SSL/TLS (for encryption), JPEG, MP3, GIF, and text encoding schemes like ASCII and UTF-8 show up here. Picture a multilingual editor who reformats and translates a document so the final reader receives it in the exact style and language they expect.

Layer 7 – Application Layer

At the top sits the layer users actually interact with—even if they don’t realize it. It provides interfaces for email, browsing, file transfers, and other network services. Protocols like HTTP, HTTPS, FTP, SMTP, DNS, and DHCP operate here. It’s like the front counter of a service desk: people walk up, make requests, and receive what they need, while the deeper layers do the hidden heavy lifting behind the wall.

2. OSI Mnemonic

“People Do Not Trust Senior People Always.”

People --- **Layer 1** (Physical)

Do --- **Layer2** (Data Link)

Not --- **Layer3** (Network)

Trust --- **Layer4** (Transport)

Senior --- **Layer5** (Session)

People --- **Layer6** (Presentation)

Always --- **Layer7** (Application)

3. OSI vs TCP/IP Model Comparison

The OSI model is like a detailed blueprint that explains *every step* of how data is supposed to travel across a network. It breaks everything into seven layers, giving each job its own space — from how bits move through cables to how apps like browsers and email work. The TCP/IP model, on the other hand, is more practical. It's the model the internet actually uses. Instead of seven layers, it keeps things simpler with four layers, combining some of the OSI functions because real-world networking doesn't always separate them.

In short, OSI is great for learning and understanding the theory, while TCP/IP is the actual engine running behind websites, apps, and the internet. OSI is the “textbook model,” and TCP/IP is the “real-life model.” Both describe the same journey of data — just in different levels of detail.

| OSI Layer | TCP/IP Layer | Explanation |
|--------------------------|-----------------------------|--|
| Application (L7) | Application Layer | TCP/IP combines user-facing services like web, email, and DNS in this layer. |
| Presentation (L6) | Application Layer | Data formatting, encryption, and compression are handled inside the TCP/IP Application layer. |
| Session (L5) | Application Layer | TCP/IP places session control (start/maintain/end communication) within application protocols. |
| Transport (L4) | Transport Layer | Ensures end-to-end delivery using TCP/UDP, handling reliability and port numbers. |
| Network (L3) | Internet Layer | Handles IP addressing, routing, and packet forwarding across networks. |
| Data Link (L2) | Network Access Layer | Responsible for frames, MAC addresses, and communication with the physical network. |
| Physical (L1) | Network Access Layer | Deals with cables, electrical/optical signals, connectors, and actual bit transmission. |

4. Protocol Data Units (PDUs)

| OSI Layer | PDU Name | Human-Friendly Explanation |
|---------------------|----------------------------------|--|
| Layer 4 – Transport | Segments (TCP) / Datagrams (UDP) | TCP breaks data into <i>segments</i> (reliable). UDP breaks data into <i>datagrams</i> (fast, no guarantee). |
| Layer 3 – Network | Packets | The layer that adds IP addresses and decides the route; it works with <i>packets</i> . |
| Layer 2 – Data Link | Frames | Adds MAC addresses and prepares data for local delivery; uses <i>frames</i> . |
| Layer 1 – Physical | Bits | Pure 0s and 1s turned into signals—just raw <i>bits</i> . |

5. Addressing Concepts

1. MAC Address – used at Layer 2 (Data Link)

A MAC address is a physical, built-in address burned into your network card. Devices inside the same LAN use MAC addresses to deliver data to the right machine. Think of it like a permanent *house number* inside a neighborhood. Layer 2 uses MAC addresses to create and deliver **frames** within a local network.

2. IP Address – used at Layer 3 (Network)

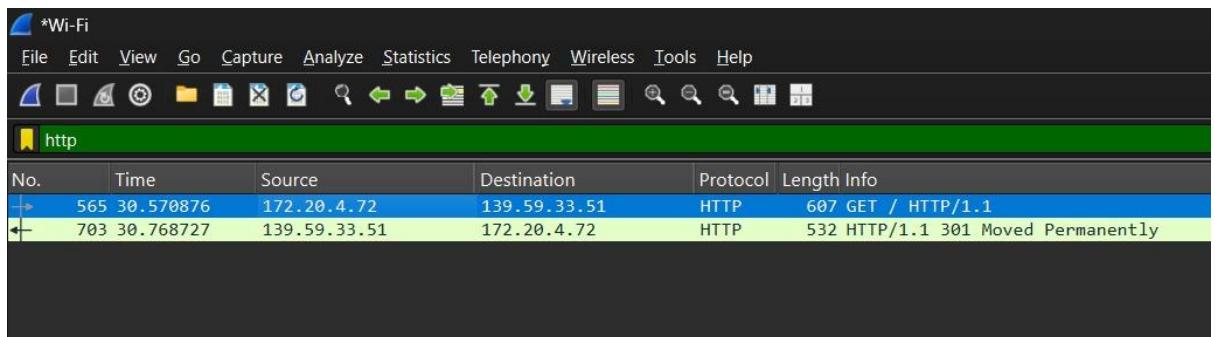

An IP address is a logical address that helps data travel between different networks. It's like your *city + street address* on the internet—routers use it to decide the best path for packets to reach another network. Layer 3 uses IP addresses to move **packets** across routers and different networks.

3. Port Number – used at Layer 4 (Transport)

A port number identifies a specific application or service running on a device. While the IP address finds the right device, the port number finds the right *app* inside that device. It's like reaching the correct room inside a building. Layer 4 uses port numbers along with TCP/UDP to deliver **segments/datagrams** to the right application.

Part B – Wireshark Practical

1. HTTP Traffic (Application over TCP)

```
▶ Frame 565: Packet, 607 bytes on wire (4856 bits), 607 bytes captured (4856 bits) on interface \Device\NP
▶ Ethernet II, Src: AzureWaveTec_50:52:92 (28:d0:43:50:52:92), Dst: Sophos_d1:3f:f0 (7c:5a:1c:d1:3f:f0)
▶ Internet Protocol Version 4, Src: 172.20.4.72, Dst: 139.59.33.51
▶ Transmission Control Protocol, Src Port: 43921, Dst Port: 80, Seq: 1, Ack: 1, Len: 553
▶ Hypertext Transfer Protocol
```

2. TCP Packets

The Wireshark interface shows a single captured session named "tcp". The packet list pane displays many entries, mostly Application Data segments (Seq=5858, Ack=68966, Win=1823, Len=39). The first few entries are:

| No. | Time | Source | Destination | Protocol | Length | Info |
|-----|----------|----------------|----------------|----------|--------|--|
| 284 | 7.199283 | 142.250.67.36 | 172.20.8.221 | TLSv1.2 | 85 | Application Data |
| 285 | 7.199283 | 142.250.67.36 | 172.20.8.221 | TLSv1.2 | 93 | Application Data |
